Regular Discussion 7 Solutions

1 Bayes Nets: Representation

Parts (a), (b), and (c) pertain to the following Bayes' Net.

Parts (d) and (e) pertain to the following CPTs.

(a) Express the joint probability distribution as a product of terms from the Bayes Nets CPTs.

P(A)P(C|A)P(B|A)P(D|B)P(E)P(F|D,E)P(G|D)

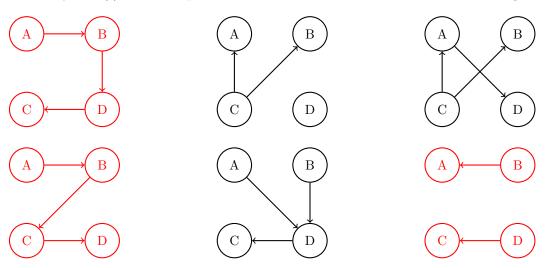

(b) Assume each node can take on 4 values. How many entries do the factors at A, D, and F have?

A: ____4 D: ____4² F: ____4³

(c) Mark all that are guaranteed to be true:

		A	В	P(B A)	В	С	P(C B)	С	D	P(D C)
A	P(A)	+a	+b	0.9	+b	+c	0.8	+c	+d	0.25
+a	0.8	+a	-b	0.1	+b	-с	0.2	+c	-d	0.75
-a	0.2	-a	+b	0.6	-b	+c	0.8	-c	+d	0.5
		-a	-b	0.4	-b	-c	0.2	-c	-d	0.5

- (d) State all non-conditional independence assumptions that are implied by the probability distribution tables. From the tables, we have $A \not\perp \!\!\!\perp B$ and $C \not\perp \!\!\!\perp D$, and $B \perp \!\!\!\perp C$.
- (e) Circle all the Bayes net(s) that can represent a distribution that is consistent with the tables given.

The question asks for Bayes Nets that **can** represent the distribution in the tables. So, in the nets we circle, the only requirement must be that A and B must not be independent, and C and D must not be independent.

The top left, bottom left, and bottom right nets have arrows between the A-B nodes and the C-D nodes, so we can circle those.

The top middle net has C and D as independent (D is not connected to anything), so we cannot circle it. The bottom middle net has A and B as independent (common effect), so we cannot circle it.

The top right net seems like it could represent the distribution, because D-separation finds that: A and B are not guaranteed to be independent (common cause), and C and D are not guaranteed to be independent (causal chain). However, since $B \perp\!\!\!\perp C$, the arrow between B and C is vacuous, thus A and B cannot actually be dependent.

2 Variable Elimination

Using the Bayes Net shown below, we want to compute $P(Y \mid +z)$. All variables have **binary domains**. We run variable elimination, with the following variable elimination ordering: X, T, U, V, W.

After inserting evidence, we have the following factors to start out with:

$$P(T), P(U|T), P(V|T), P(W|T), P(X|T), P(Y|V, W), P(+z|X)$$

(a) When eliminating X we generate a new factor f_1 as follows,

$$f_1(+z|T) = \sum_x P(x|T)P(+z|x)$$

which leaves us with the factors:

$$P(T), P(U|T), P(V|T), P(W|T), P(Y|V, W), f_1(+z|T)$$

٧

U

(b) When eliminating T we generate a new factor f_2 as follows, which leaves us with the factors:

$$f_2(U, V, W, +z) = \sum_t P(t)P(U|t)P(V|t)P(W|t)f_1(+z|t) \qquad P(Y|V, W), f_2(U, V, W, +z)$$

(c) When eliminating U we generate a new factor f_3 as follows, which leaves us with the factors:

$$f_3(V, W, +z) = \sum_{u} f_2(u, V, W, +z)$$
 $P(Y|V, W), f_3(V, W, +z)$

Note that U could have just been deleted from the original graph, because $\sum_{u} P(U|t) = 1$. We can see this in the graph: we can remove any leaf node that is not a query variable or an evidence variable.

(d) When eliminating V we generate a new factor f_4 as follows, which leaves us with the factors:

$$f_4(W, Y, +z) = \sum_{v} f_3(v, W, +z) P(Y|v, W)$$
 $f_4(W, Y, +z)$

(e) When eliminating W we generate a new factor f_5 as follows, which leaves us with the factors:

$$f_5(Y, +z) = \sum_{w} f_4(w, Y, +z)$$
 $f_5(Y, +z)$

(f) How would you obtain $P(Y \mid +z)$ from the factors left above: Simply renormalize $f_5(Y,+z)$ to obtain $P(Y \mid +z)$. Concretely,

$$P(y \mid +z) = \frac{f_5(y, +z)}{\sum_{y'} f_5(y', +z)}$$

(g) What is the size of the largest factor that gets generated during the above process? $f_2(U, V, W, +z)$. This contains 3 unconditioned variables, so it will have $2^3 = 8$ entries (U, V, W) are binary variables, and we only need to store the entries for +z for each possible setting of these variables).

3

(h) Does there exist a better elimination ordering (one which generates smaller largest factors)? Yes. One such ordering is X, U, T, V, W. All factors generated with this ordering contain at most 2 unconditioned variables, so the tables will have at most $2^2 = 4$ entries (as all variables are binary).
