Note: Your TA probably will not cover all the problems. This is totally fine, the discussion worksheets are not designed to be finished in an hour. They are deliberately made long so they can serve as a resource you can use to practice, reinforce, and build upon concepts discussed in lecture, readings, and the homework.

1 FFT Intro

We will use ω_n to denote the first *n*-th root of unity $\omega_n = e^{2\pi i/n}$. The most important fact about roots of unity for our purposes is that the squares of the 2*n*-th roots of unity are the *n*-th roots of unity.

Fast Fourier Transform! The Fast Fourier Transform FFT(p, n) takes arguments n, some power of 2, and p is some vector $[p_0, p_1, \ldots, p_{n-1}]$.

Here, we describe how we can view FFT as a way to perform a specific matrix multiplication involving the DFT matrix. Note, however, that the FFT algorithm will not explicitly compute this matrix. We have written out the matrix below for convenience.

Treating p as a polynomial $P(x) = p_0 + p_1 x + \ldots + p_{n-1} x^{n-1}$, the FFT computes the value of P(x) for all x that are n-th roots of unity by computing the result of the following matrix multiplication in $\mathcal{O}(n \log n)$ time:

$$\begin{bmatrix} P(1) \\ P(\omega_n) \\ P(\omega_n^2) \\ \vdots \\ P(\omega_n^{n-1}) \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & \dots & 1 \\ 1 & \omega_n^1 & \omega_n^2 & \dots & \omega_n^{(n-1)} \\ 1 & \omega_n^2 & \omega_n^4 & \dots & \omega_n^{2(n-1)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & \omega_n^{(n-1)} & \omega_n^{2(n-1)} & \dots & \omega_n^{(n-1)(n-1)} \end{bmatrix} \cdot \begin{bmatrix} p_0 \\ p_1 \\ p_2 \\ \vdots \\ p_{n-1} \end{bmatrix}$$

If we let $E(x) = p_0 + p_2 x + \dots p_{n-2} x^{n/2-1}$ and $O(x) = p_1 + p_3 x + \dots p_{n-1} x^{n/2-1}$, then $P(x) = E(x^2) + xO(x^2)$, and then FFT(p,n) can be expressed as a divide-and-conquer algorithm:

- 1. Compute E' = FFT(E, n/2) and O' = FFT(O, n/2).
- 2. For $i = 0 \dots n 1$, assign $P(\omega_n^i) \leftarrow E((\omega_n^i)^2) + \omega_n^i O((\omega_n^i)^2)$

Also observe that

$$\frac{1}{n} \begin{bmatrix} 1 & 1 & 1 & \dots & 1 \\ 1 & \omega_n^{-1} & \omega_n^{-2} & \dots & \omega_n^{-(n-1)} \\ 1 & \omega_n^{-2} & \omega_n^{-4} & \dots & \omega_n^{-2(n-1)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & \omega_n^{-(n-1)} & \omega_n^{-2(n-1)} & \dots & \omega_n^{-(n-1)(n-1)} \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 & \dots & 1 \\ 1 & \omega_n^1 & \omega_n^2 & \dots & \omega_n^{(n-1)} \\ 1 & \omega_n^2 & \omega_n^4 & \dots & \omega_n^{2(n-1)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & \omega_n^{(n-1)} & \omega_n^{2(n-1)} & \dots & \omega_n^{(n-1)(n-1)} \end{bmatrix}^{-1}$$

(You should verify this on your own!) And so given the values $P(1), P(\omega_n), P(\omega_n^2), \ldots$, we can compute P by finding the result of the following matrix multiplication in $O(n \log n)$ time:

$$\begin{bmatrix} p_0 \\ p_1 \\ p_2 \\ \vdots \\ p_{n-1} \end{bmatrix} = \frac{1}{n} \begin{bmatrix} 1 & 1 & 1 & \dots & 1 \\ 1 & \omega_n^{-1} & \omega_n^{-2} & \dots & \omega_n^{-(n-1)} \\ 1 & \omega_n^{-2} & \omega_n^{-4} & \dots & \omega_n^{-2(n-1)} \\ \vdots & \vdots & \vdots & \ddots & \vdots \\ 1 & \omega_n^{-(n-1)} & \omega_n^{-2(n-1)} & \dots & \omega_n^{-(n-1)(n-1)} \end{bmatrix} \cdot \begin{bmatrix} P(1) \\ P(\omega_n) \\ P(\omega_n^2) \\ \vdots \\ P(\omega_n^{n-1}) \end{bmatrix}$$

This can be done in $O(n \log n)$ time using a similar divide and conquer algorithm.

- (a) Let $p = [p_0]$. What is FFT(p, 1)?
- (b) Use the FFT algorithm to compute FFT([1,4],2) and FFT([3,2],2).

(c) Use your answers to the previous parts to compute FFT([1, 3, 4, 2], 4).

(d) Describe how to multiply two polynomials p(x), q(x) in coefficient form of degree at most d.

2 (Challenge Problem) Cartesian Sum

Let A and B be two sets of integers in the range 0 to 10n. The Cartesian sum of A and B is defined as

$$A + B = \{a + b \mid a \in A, b \in B\}$$

i.e. all sums of an element from A and an element with B. For example, $\{1,3\}+\{2,4\}=\{3,5,7\}$.

Note that the values of A+B are integers in the range 0 to 20n. Design an algorithm that finds the elements of A+B in $\mathcal{O}(n \log n)$ time, which additionally tells you for each $c \in A+B$, how many pairs $a \in A, b \in B$ there are such that a+b=c.

Hint: Notice that $(x^1 + x^3) \cdot (x^2 + x^4) = x^3 + 2x^5 + x^7$

3 (Challenge Problem) Cubed Roots of Unity

(a) Cubing the 9^{th} roots of unity gives the 3^{rd} roots of unity. Next to each of the third roots below, write down the corresponding 9^{th} roots which cube to it. The first has been filled for you. We will use ω_9 to represent the primitive 9^{th} root of unity, and ω_3 to represent the primitive 3^{rd} root.

$$\omega_3^0:\omega_9^0, \qquad ,$$
 $\omega_3^1: \qquad , \qquad ,$ $\omega_3^2: \qquad , \qquad ,$

- (b) You want to run FFT on a degree-8 polynomial, but you don't like having to pad it with 0s to make (degree+1) a power of 2. Instead, you realize that 9 is a power of 3, and you decide to work directly with 9th roots of unity and use the fact proven in part (a). Say that your polynomial looks like $P(x) = a_0 + a_1x + a_2x^2 + ... + a_8x^8$. Describe a way to split P(x) into three pieces (instead of two) so that you can make an FFT-like divide-and-conquer algorithm.
- (c) What is the runtime of FFT when we divide the polynomial into three pieces instead of two?

4 Connectivity vs Strong Connectivity

- (a) Prove that in any connected undirected graph G=(V,E) there is a vertex $v\in V$ such that removing v from G gives another connected graph.
- (b) Give an example of a strongly connected directed graph G = (V, E) such that, for every $v \in V$, removing v from G gives a directed graph that is not strongly connected.
- (c) Let G = (V, E) be a connected undirected graph such that G remains connected after removing any vertex. Show that for every pair of vertices u, v where $(u, v) \notin E$ there exist two different u-v paths.

5 Short Answer

For each of the following, either prove the statement is true or give a counterexample to show it is false.

- (a) If (u, v) is an edge in an undirected graph and during DFS, post(v) < post(u), then u is an ancestor of v in the DFS tree.
- (b) In a directed graph, if there is a path from u to v and pre(u) < pre(v) then u is an ancestor of v in the DFS tree.
- (c) In any connected undirected graph G there is a vertex whose removal leaves G connected.
